

## **JAVA FORMS WITH JAVA BEANS - Quiz**

1. Why we use the action attribute in form tag?

Specify the URL where the form must be submitted.

2. \_\_\_\_\_ method used to get the value of form parameter that returns multiple values.

```
request.getParameterValues();
```

3. \_\_\_\_\_ method used to get the context path.

```
request.ContextPath();
```

4. Required attribute works for checkbox and radio button?

False

5. \_\_\_\_\_ tag is used to locate a bean class.

```
<jsp:useBean> </jsp:useBean>
```

6. \_\_\_\_\_ tag is used to set the property in the bean using setter method.

```
<jsp:setProperty>
```

7. \_\_\_\_\_ tag is used to set the property in the bean using getter method.

```
<jsp:getProperty>
```

Scope Value	Description
Application	used to make the impact over entire application.
Request	A JSP object created using the Request scope can be accessed from any pages that serves that request.
Page	A JSP object created using the Page scope can be accessed only from within the same page where it was created.

- `<jsp:setProperty property="*" name="user"/>`
- What does the \* means in the above code?

One to one correspondence between form submitted data and bean.
