SPRING FRAMEWORK AUTOWIRE SCENARIOS

App.java

```
package org.studyeasy;
import org.springframework.context.annotation.AnnotationConfigApplicationContext;
import org.studyeasy.interfaces.Car;

public class App {
  public static void main(String[] args) {

    // Outsourcing Object Creation process
    AnnotationConfigApplicationContext context = new
    AnnotationConfigApplicationContext(AppConfig.class);

    // Outsource the work to Spring.
    Car myCar = context.getBean("co", Car.class);
    myCar.specs();

    // Closing the context also
    context.close();
}
```

Engine.java

```
package org.studyeasy.cars;
import org.springframework.stereotype.Component;
@Component
public class Engine {
String type = "V8";
}
```

Corolla.java

```
package org.studyeasy.cars;

import org.springframework.beans.factory.annotation.Autowired;
import org.springframework.stereotype.Component;
import org.studyeasy.interfaces.Car;

@Component("co")
public class Corolla implements Car {

    @Autowired
    Engine engine;

    @Override
    public void specs() {

        System.out.println("Sedan from Toyota wit engine as : " +engine.type);
    }
}
```

Swift.java

```
package org.studyeasy.cars;
import org.springframework.stereotype.Component;
import org.studyeasy.interfaces.Car;

@Component("sw")
public class Swift implements Car{

@Override
public void specs() {
    System.out.println("Hatchback from Suzuki");
}
```

AppConfig.java

```
package org.studyeasy;
import org.springframework.context.annotation.ComponentScan;
import org.springframework.context.annotation.Configuration;

// Telling Spring that it is configuration class and which particular package to scan for
// components

@Configuration
@ComponentScan("org.studyeasy")
public class AppConfig {
```

Car.java

```
package org.studyeasy.interfaces;
public interface Car {
void specs();
}
```

Scenario 1:

If we have a parametrized constructor, there will be no default constructor inside this class by Java.

When the Spring will try to create a object using the bean factory, we won't be able to intialize the reference and application will crash. (Engine.java)

In short, the application will crash because there is no way to automatically create a object without a default constructor. (Engine.java).

Adding a Parameterized Constructor to the class Engine

```
public Engine(String type) {
super();
this.type = type;
}
```

You get error

```
9:54:37 PM org.springframework.context.support.AbstractApplicationContext refreeption encountered during context initialization - cancelling refresh attempt:

at org.springframework.beans.factory.support.ConstructorResolver.createArgumentArray(<a href="ConstructorResolver.java:782">ConstructorResolver.java:782</a>)
```

The Solution is Get rid of the parameterized constructor and in order to create a constructor we will create the constructor for the property directly inside the bean class (Corolla.java).

In Corolla.java

```
public Corolla(Engine engine) {
engine.type = "V6";
//this.engine = engine; -> This is optional
}
```

We wil get ouput as:- Sedan from Toyota wit engine as: V6

Somewhat we are able to overide and get output.

In Corolla.java: Below following is also fine

```
public Corolla(Engine engine) {
engine.type = "V6";
//this.engine = engine;
}
```

```
@Autowired
public Corolla(Engine engine) {
engine.type = "V6";
}
```

```
@Autowired
public Corolla(Engine engine) {
engine.type = "V6";
//this.engine = engine; -> If we keep this line it is also fine
}
```

As it is called or executed as soon as object created. (Engine engine;)

We get Error like below:-

```
Exception in thread "main" java.lang.NullPointerException: Cannot read field "type" because "this.engine" is null at org.studyeasy.cars.Corolla.specs(Corolla.java:23) at org.studyeasy.App.main(App.java:14)
```

Solution

```
@Autowired
public Corolla(Engine engine) {
engine.type = "V6";
this.engine = engine; <- Uncomment this out
}</pre>
```

We can autowire the constructor or the reference both - No issue at all.

Scenario 2: Using getter

Commenting out the constructor and using getter. Add getter in Corolla.java.

```
public void setEngine(Engine engine) {
this.engine = engine;
}
```

Add below line in above getter

```
engine.type = "V10";
```

```
The Output:-
```

```
Sedan from Toyota wit engine as : V8
```

The reason is the setter work in a different way. When we autowire the reference, a new object with the default constructor will be created. We will se the default value only.

To run the setter, it is essential to use autowire on the setter.

```
@Autowired
public void setEngine(Engine engine) {
engine.type = "V10";
this.engine = engine;
}
```

Output

```
Sedan from Toyota wit engine as: V10
```

```
@Autowired
public void setEngine(Engine engine) {
engine.type = "V10";
//this.engine = engine; <- Comment out this line you app will crash
}</pre>
```

You get output like below

```
Exception in thread "main" java.lang.NullPointerException: Cannot read field "type" because "this.engine" is null at org.studyeasy.cars.Corolla.specs(Corolla.java:46) at org.studyeasy.App.main(App.java:14)
```

Qualifier Annotation

Let us say that Engine class is a interface. Make and modify it as interface. Move Engine Class to interfaces package.

```
package org.studyeasy.interfaces;
public interface Engine {
String specs();
}
```

Create a new Class -> Package name : org.studyeasy.specs

Class Name : V8 -> It should also implement Engine Interface

Create a new Class -> Package name : org.studyeasy.specs

Class Name : V6 -> It should also implement Engine Interface

V6.java

```
package org.studyeasy.specs;
import org.studyeasy.interfaces.Engine;
public class V6 implements Engine{
@Override
public String specs() {
return "V6 Engine";
}
}
```

V8.java

```
package org.studyeasy.specs;
import org.studyeasy.interfaces.Engine;
public class V8 implements Engine {
    @Override
    public String specs() {
    return "V8 Engine";
    }
}
```

These 2 Classes are Components as well. So mark both classes with @Component.

In Corolla.java

```
package org.studyeasy.cars;
import org.springframework.stereotype.Component;
import org.studyeasy.interfaces.Car;
import org.studyeasy.interfaces.Engine;

@Component("co")
public class Corolla implements Car {

@Autowired
Engine engine;

@Override
public void specs() {
System.out.println("Sedan from Toyota wit engine as : " + engine.specs());
}
}
```

Output:- The applictaion will crash.

```
